Green zones leading the way in interior design

Interior design is taking a leaf from the great outdoors with 'green zones' growing in popularity across Australia, according to **Ambius**, one of the world's leading interior plantscaping companies.

Chosen for their environmental, health and aesthetic benefits, these areas feature indoor plant installations which act as an architectural feature for corporate, retail and hospitality environments.

One of the most popular 'green zone' options is the *Schiavello Vertical Garden*. This grid system allows numerous potted plants to be arranged in freestanding columns or walls, dramatically transforming any space.

Rachael O'Keefe, **Ambius** National Design Manager, said lush interior features are very much in vogue with demand expected to continue to increase, particularly in the corporate sector.

"Green zones create a fresh, contemporary look for internal spaces that generate a real wow factor. With so many of us spending a large proportion of

Greener on the inside

our days at work in offices, plant installations provide us with a way to make these environments greener on the inside.”

“Savvy employers are recognising the benefits of providing quality office fitouts for their staff. Beyond the health benefits that result in happier and healthier employees, green zones can also reduce noise levels in open plan offices,” said O’Keefe.

Further highlighting their importance, the Green Building Council of Australia recognises the benefits of indoor plants in its Green Star rating program.
